

WATER-GLO™ 23-G Fluorescent Leak Detection Additive

PINPOINT VEHICLE LEAKS FAST!

Detects water/coolant leaks in radiators, water hoses, heaters, water pumps, freeze plugs, gaskets, etc.

1 U.S. Gallon (3.8 liters)

FOR USE BY QUALIFIED SERVICE PERSONNEL ONLY

STORE IN A COOL PLACE

WATER-GLO 23 fluorescent dye additive is designed for use in the quick detection of even hard-to-find water/coolant leaks in radiators, water hoses, heaters, water pumps, freeze plugs, gaskets, etc. The additive acts as a tracer and, when used with Spectroline® ultraviolet (UV) lamp, enables the serviceman to immediately pinpoint the source of leak. WATER-GLO 23 is proven safe to all automotive components, and is compatible with all major radiator solutions.

DIRECTIONS:

1. Add WATER-GLO 23 to the suspect system. The recommended dosage is one ounce for every 16 gallons of water.
2. Turn on the engine and run the system for 5-10 minutes to circulate the additive throughout.
3. To locate the leaks(s), shine a Spectroline UV lamp on the suspect areas. A bright green glow will be visible at the site of the leak and along the leakage path. For suspect areas obstructed from view: Wipe with a clean white cloth, again checking for the fluorescent green response. Note: Fluorescent contrast can be heightened by shielding or dimming room light.
4. Since WATER-GLO 23 may safely remain in the system, use the original additive to check

COMBUSTIBLE MIXTURE

the repair: After fixing the leak, wipe the residual additive from the surface area with any conventional shop cleaner. Run the system again and scan with the UV lamp as before. No glowing spots will be evident if the system is in fact leak-free.

CAUTION:

To prevent freezing, WATER-GLO 23 must be stored at a temperature above 32°F (0°C). Also, it must be stored away from heat sources and open flame. For use by qualified service personnel only. May be harmful or fatal if swallowed. Avoid contact with eyes or skin. Wash thoroughly after handling.

CONTAINS WATER AND ORGANIC DYE
